Keyboard Macro Utility for The X Window System. Write a set of keyboard macros that are executed as input to an X11 window or tty. This is an X utility, but any X11 application can use it to access special keyboard sequences. Keymacro also includes a program (xmacro) that makes it easy to define and run macros. You can create macros by typing at the X11 command line, or by typing at the X11 command line a sequence of keystrokes to invoke the program xmacro (e.g., 'xmacro: a b c d e' or 'xmacro abcdefgxyz') and the macro definition (e.g., '# xmacro: /window xmacro). Macros are stored in xmacro as the data string '#' and '#'. When an X11 application (e.g., gnome-terminal, xclock) invokes a macro that uses the keyword 'xmacro', Keymacro first checks for a.xmacro file that defines the macro and executes the macro if it exists. (Main features: * Full Unicode support, see * Create keyboard macros with combinations of keystrokes. * Macro definitions can include the keywords 'xmacro' and 'xmacro-all' to create a menu of choices. * Macros can be created in any X11 window. You can store macros in the window's frame. * Macros can be stored as a file or in the window's frame. * Macros are stored in.xmacro files. * Macros can be reused. * Macros can be reused from multiple windows. * Macros can be recorded, and later played back. * Macros can be sent to other applications using the clipboard. * Macros can be sent to other applications using xmacro. * Keymacro supports

multiple keyboards. * Keyboard macros can be created with any modifier key, for example, CTRL+SHIFT+F1. * Keymacro supports "Multitasking Mode". This means that you can move the mouse pointer to another X11 window to trigger a macro from there. 81e310abfb
