AutoCAD is one of the most widely used commercial computer-aided design (CAD) applications in the world. It is available on PCs, Macs, mobile devices, workstations and supercomputers. AutoCAD was first released in December 1982 as a desktop app running on microcomputers with internal graphics controllers, and soon became the choice for CAD designers. Before AutoCAD, most commercial CAD programs ran on mainframe computers or minicomputers, with each CAD operator (user) working at a separate graphics terminal. AutoCAD is also available as mobile and web apps, so users can access and create designs anywhere there is an internet connection. This tutorial demonstrates how to create and complete a carport in AutoCAD. We will show you: How to create a carport in AutoCAD How to generate a plan view of the carport and move to the next step How to draw the garage and move to the next step How to create the roof section and move to the next step How to create the footings and move to the next step How to create a blueprint of the garage, including the carport How to complete the carport plan view In the next tutorial, we will learn how to use the 2D snap to create a perspective view of the entire garage. How to create a carport in AutoCAD In this tutorial, we will show you how to use the 2D snap in AutoCAD to create a carport. In AutoCAD, click on the 2D snap tool on the toolbar. This enables you to draw a straight line to any existing 3D line or point. Once a line is snapped, it turns into a dashed line. You can then click and drag a 2D line and snap it to any other line or point. To create a carport, we will first draw a rectangle to define the area of the garage. Then, we will draw 2 perpendicular lines on top of it to define the carport area. Finally, we will draw a rectangle to mark the carport. Step 1. Open AutoCAD Step 2. Start the drawing session Step 3. Start drawing the carport The initial drawing session can be created in either the acad.dwg or acad.dwgw document, depending on your preference. In this

Processors The term processor, or processor, in CAD and graphic software refers to the type of processor used in a computer to execute CAD software. CAD software often comes with its own built-in processor, which may be a single-chip or multiple-chip architecture system processor. However, in a multi-CPU system a special device can be used to coordinate the various CPUs and minimize the overhead of doing so. A processor is usually used as a synonym for Central Processing Unit (CPU). The majority of desktop CAD software used today is built with either x86 or PowerPC architectures. Since the Intel x86 architecture is far more widely used, most desktop CAD software is made for Intel-based machines. The processors are an integral part of the CAD software. Most of the software is designed around the architecture of the processor. The use of Open Source software will allow users to create CAD programs for the Macintosh platform, Unix, and other operating systems. One of the first applications for the Macintosh platform was the Cadalyst Graphics Editor, in 1984. Cadalyst is considered the de facto standard development environment for AutoCAD and many of its siblings, and a number of similar applications exist today. The now ubiquitous terms WinCAD and Windows CAD refer to a graphics editor for the Windows platform, and AutoCAD refers to a graphics application for the Macintosh platform. Programming languages Programming languages can be found in several categories. Computer-aided design (CAD) applications can be written in a compiled language, such as C++ or Java, or they can use an interpreted language, such as Visual Basic, Java, or Perl. The most widely used languages are Lisp and C++. AutoCAD provides APIs for their use. Lisp, a declarative language, is used to create macros, graphical user interface elements, and views, among other features. C++, a procedural language, is used to create tools and other applications. VBA, an object-oriented programming language, provides the capability to create applications on Microsoft Office systems and the Windows operating system. Perl provides an interpreted language for quick scripting. One of the most common languages used to create add-on applications is ObjectARX, which is based on the COM automation technology and makes it possible to write applications in C++. There are a number of common features that CAD systems have in common, such as: Dynamic dimensioning Parameterized relationships Feature-based modeling Numeric solids Parametric constraints a1d647c40b

475 P.2d 1101 (1970) 80 N.M. 71 Henry C. COULTER, Jr., Plaintiff-Appellant, v. ILLINOIS CENTRAL GULF RAILROAD COMPANY, a corporation, Defendant-Appellee. No. 3632. Supreme Court of New Mexico. March 9, 1970. *1102 W.R. Givens, Albuquerque, for appellant. Modrall, Seymour, Sperling, Roehl & Harris, Albuquerque, for appellee. OPINION MOISE, Justice. Plaintiff appeals from an order granting a new trial. He was a crewman employed by defendant. Plaintiff's injury occurred while he was doing a job for defendant at the Cimarron cross-over. He was digging a ditch and in the process of putting dirt into the ditch a piece of loose sand or dirt struck him in the eye causing injury. He filed a suit in tort alleging negligence on the part of defendant in failing to provide a safe place to work and in failing to warn him of a dangerous condition. The trial was had on March 8, 1969. A verdict was returned for defendant. The jury was polled and the verdict was accepted and judgment entered. Plaintiff subsequently made a motion for a new trial. The motion was based on the following grounds: 1. That the court erred in refusing to admit testimony of witnesses concerning an exhibit presented by plaintiff, which the court had previously refused to admit. 2. That the court erred in giving a cautionary instruction at the request of defendant after the plaintiff had rested. 3. That the court erred in its charge to the jury. 4. That the verdict was excessive in that it was larger than that which would have been given under the same evidence if it had been given in reference to a worker who was not a railroad employee. 5. That the damages are excessive in that they are greater than the normal range of future earnings of plaintiff. *1103 The first ground was rejected by the court. Plaintiff appeals from that ruling. Plaintiff's assignment of error on this point is based upon what he asserts is a denial of his right to fully cross-examine. It appears to be argued that the party presenting an exhibit is thereby afforded a right to do so at a time when the opposing party has an opportunity to examine and examine it, and that
